**Requirements for v1-0**

Version 10, last updated by [meijer](#) at 2011-05-26

The following outlines client and server requirements for the 1.0 release:

#### Client

- **Web browser** - modern, current release (browser limitations apply to Google Gears plugin)
- **Flash Player 10.x browser plugin** - required for user interface; used for uploads up to 2.0 GB, if Google Gears is not installed / enabled
- **Google Gears browser plugin** - required for uploading files > 2 GB (**currently not possible on Mac OSX and Linux**) (for a list of browser versions supported by Google Gears see <http://gears.google.com/>); if a user attempts a large upload without Gears, they will be prompted to install Gears or that this is not possible, depending on their OS; used for all file uploads if installed and enabled. To install the plugin:
  - **for supported browsers / versions:** <http://gears.google.com/download.html>
  - **If using Firefox on Linux try:** <http://gears64.org/>
  - For Firefox on windows there is a Gears Add On that can be used if the normal installation isn't possible: <https://addons.mozilla.org/en-US/firefox/addon/13492>

#### Server

- **64-bit Linux**
- **Webserver** - any webserver will do, however our documentation assumes [Apache 2+](#); **ensure that the webserver is only reachable over HTTPS and the files directory is non-exec** (see the [Administrator\\_reference\\_manual](#) for more information, and the [FAQ](#) for a quite relevant entry on why self signed certificates won't easily work)
- **PHP 5.2.10+** - PHP has to be 64bits aware
- **PostgreSQL 8.3.9+ database** - we test on 8.3.9+, but earlier versions might work
- **SimpleSamlPHP 1.5.1-1.6.3** - Version 1.7.0 and higher are supported as of FileSender 1.0.1
- **Mail Transport Agent (MTA)** - Any decent MTA will do (Postfix, Exim, Sendmail). FileSender needs to be able to send out emails.
